The genetic basis of human traits can be discovered through analyzing the results of matings that have already occurred, i.e. through pedigree analysis. Pedigrees are family trees which show the parents and offspring across generations, as well as who possessed particular traits.

Pedigree Analysis: Genetic Analysis of Humans - Biology ...

Genetics in humans cannot be studied by performing controlled crosses rather, analysis of inheritance patterns in an existing population must be used. An approach, called pedigree analysis, is used to study the inheritance of genes in humans.

The family study, which includes typing of the proband's mother, father, and all full siblings, provides an internal verification of the patient's HLA haplotypes. Because HLA genes segregate in classic Mendelian fashion, the probability that a sibling inherits the same parental haplotypes is 25% (genotypically identical). The probability that a sibling inherits one identical paternal or maternal haplotype plus one nonshared haplotype is 50% (haploidentical).

-Pedigree: a diagram showing the lineage or genealogy of an individual and all the direct ancestors, usually to analyze or follow the inheritance of a trait All of the above serve an important purpose in the field of human genetics. Gene mapping and pedigrees allow us to visualize inheritance patterns, which helps further the understanding of how traits are passed down, enabling us to look further into how to cure genetic diseases.

And a pedigree is a way of analyzing the inheritance patterns of a trait within a family. And it can be useful to understand more about that trait, maybe to make some insights about the genetics of that trait, and it's a way to think about what's happened in the past in a family, and then maybe we can help get some probabilities or get some understanding of what might happen in the future.
